

# **FOREWORD**

Population dynamics have proved its importance in the development of a country. Demographic statistics are inevitable for policymakers, planners and administrators for planning of developmental programmes for the national & provincial governments.

2. The most significant contribution of Pakistan Demographic Survey (PDS) being conducted during intercensal period is to provide reliable data on population dynamics such as its size, rate of growth with its two principal indicators i.e. birth rate & death rate and as other related demographic variables.

3. The present PDS report is the Nineteenth of the Series started in 1984, which provides the detailed information on fertility & mortality for the year 2007 at national level with urban-rural breakdown. I am sure it will be useful to administrators, planners, policymakers, researchers and other users working in Socio-Economic and demographic fields.

4. Suggestions for improvement will be welcomed.

**TARIQ SHAFIQ KHAN**  
Secretary

Statistics Division  
Government Of Pakistan

## INTRODUCTION

Traditional sources for vital statistics are the Civil Registration System (birth and death registration system) and population census. The Civil Registration System in Pakistan, as in several other developing countries appears highly deficient and inadequate to provide reliable birth and death statistics.

2. In the absence of an efficient civil registration system and inability of decennial census to provide birth and death statistics, during the intercensal periods, several demographic surveys have been undertaken by the Federal Bureau of Statistics in the country since, early sixties either independently or in collaboration with other organizations. The current series of demographic surveys, known as Pakistan Demographic Survey (PDS) was launched in 1984. This report pertains to the data collected through PDS during 2007.

### Objectives

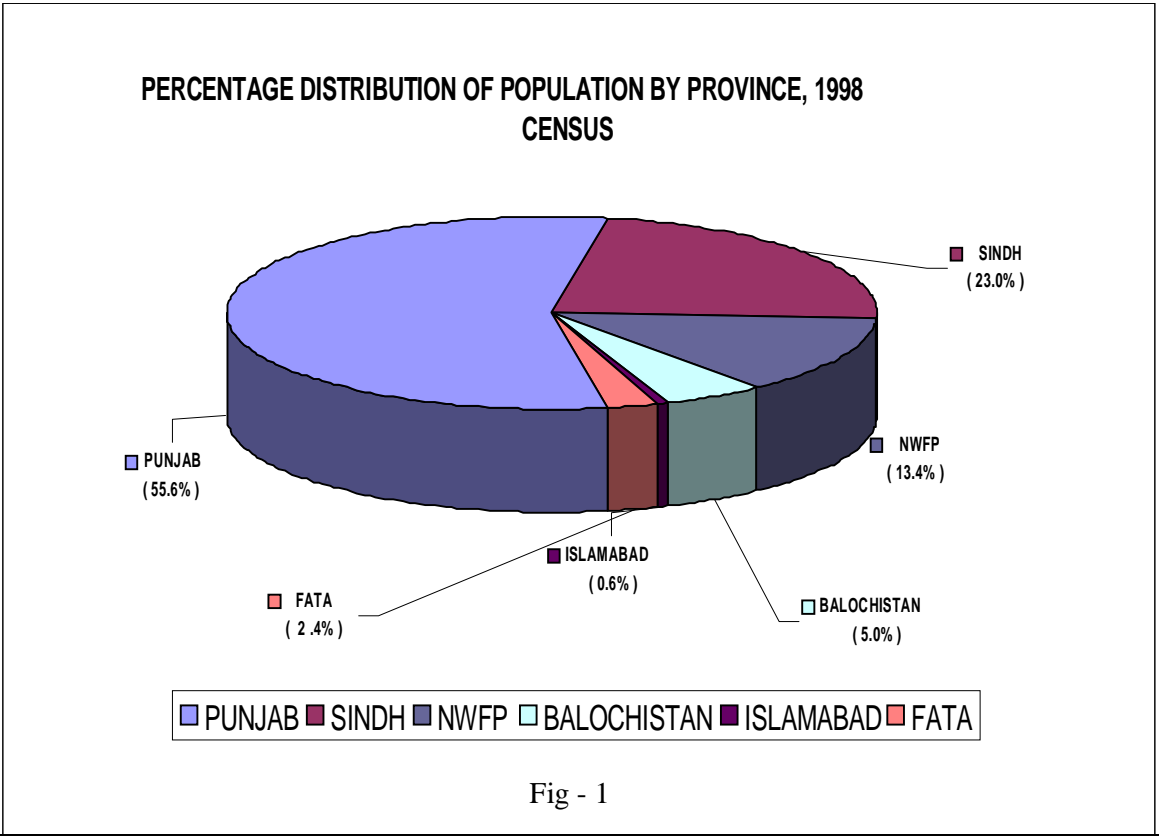

3. The main objectives of the PDS survey are: -
- i. to collect statistics of births and deaths in order to arrive at various measures of fertility and mortality for Pakistan and its rural and urban areas;
  - ii. to estimate current rate of natural increase of population at national level.
  - iii. to collect information on other selected characteristics of population to assess the impact of family planning and other Socio-Economic development programmes.

## Administrative set up of the country

4. Pakistan is administratively divided into four provinces, namely, Punjab, Sindh, North West Frontier Province (NWFP) and Balochistan. Its population and area is unevenly distributed. Balochistan is the largest province by area, with about 44 percent of total area however, contains only 5 percent of the total population. Punjab is the most populous province; its population exceeds the aggregates of the other three provinces. Table 1.1 gives the distribution of area, population (also figure 1), annual growth rate and population density of the country as enumerated in the census of 1981 and 1998. Islamabad being the capital of Pakistan so its population is presented separately. The data of Federally Administered Tribal Area (FATA) are also shown separately.

**Table 1.1: Distributions of Area, Population by Province and Annual Growth Rate**

PROVINCE	Area		Population [In thousand]				Population Density [Per sq km]		Inter Censal Annual Growth Rate %
	(Sq. Km)	%	1981	%	1998	%	1981	1998	1998
Pakistan	796095	100.0	84254	100.0	132352	100.0	106	166	2.69
Punjab	205344	25.8	47293	56.1	73621	55.6	230	359	2.64
Sindh	140914	17.7	19029	22.6	30440	23.0	135	216	2.80
NWFP	74521	9.4	11061	13.1	17744	13.4	148	238	2.82
Balochistan	347190	43.6	4332	5.2	6566	5.0	12	19	2.48
Islamabad	906	0.1	340	0.4	805	0.6	376	889	5.20
Fata	27220	3.4	2199	2.6	3176	2.4	81	117	2.19

**Concepts and Definitions**

5. Concepts and definitions used in the survey are as follows:
- i. Crude birth rate is defined as the number of births in a year per 1000 persons (based on mid year population).
  - ii. General fertility rate is defined as the number of births in a year per 1000 women of childbearing ages (Females of ages 15-49).
  - iii. Age specific fertility rate is defined as the number of births by age of mother per 1000 females in the same age group.
  - iv. Age specific marital fertility rate is defined as the number of births by age of mother per 1000 currently married females in the same age group.
  - v. Total fertility rate is defined as the average number of children, which a cohort of 1000 women would bear during their reproductive span if they experience no mortality and are exposed to the age specific birth rate in effect during a particular year.

- vi. Crude death rate is defined as the number of deaths during a year per 1000 persons (based on mid year population).
- vii. Age specific death rate is defined as the number of deaths in a given age group during a year per 1000 persons in the same age group.
- viii. Life expectancy at birth is defined as the total number of years a person would be lived after birth.
- ix. Infant mortality rate is defined as the number of deaths under one year of age during a year per 1000 live births during the same year.
- x. Neo-natal and post-neo-natal Mortality Rates
  - a. Neo-natal mortality rate is defined as the number of deaths of infants under 1 month of age during a year per 1000 live births during the same year.
  - b. Post-neo-natal mortality rate is defined as the number of infant deaths at 1 through 11 months of age during a year per 1000 live births during the same year.
- xi. Sex Ratio is defined as the number of males per hundred females.
- xii. Dependency Ratio is defined as the proportion of children under 15 years and old persons aged 65 years and above to the population between ages 15 to 64 years. The ratio is expressed as percentage.
- xiii. Literate is a person who can read and write a simple statement with understanding in any language.
- xiv. Household is defined to be constituted of those persons who usually live together and share their meals. A household consists of one or more persons who may or may not be related to one another.
- xv. Whipple's Index reflects the preference for or avoidance of a particular terminal digit or of each terminal digit. It varies between 100-500 showing no preferences & high preferences of digit '0' and 5.
- xvi. Singulate Mean Age At Marriage is an estimate of the mean number of years lived by a cohort of males or females before their first marriage.
- xvii. Maternal Mortality Rate is defined as the number of deaths due to puerperal cause per 100,000 live births.

## SAMPLE DESIGN

### Universe

The Universe consists of all urban and rural areas of the four provinces of Pakistan defined as such by 1998 Population Census excluding FATA & Military restricted areas of NWFP. The population of excluded areas constitutes 3% of the total population.

### Sampling Frame

Federal Bureau of Statistics has developed its own sampling frame for urban areas. Each city / town has been divided into a number of enumeration blocks. Each enumeration block consists of 200 to 250 households on the average with well-defined boundaries and maps. The lists of enumeration blocks as updated during 2003 - 2004 and the lists of villages/mouzas/dehs published by Population Census Organization as a result of 1998 Population Census have been taken as sampling frame. Enumeration blocks and villages have been considered as primary sampling units (PSUs) for urban and rural domain respectively.

### Stratification Plan

#### a. Urban Domain

##### i. **Large Sized Cities**

Large sized cities i.e. Karachi, Lahore, Gujranwala, Faisalabad, Rawalpindi, Multan, Sialkot, Sargodha, Bahawalpur, Hyderabad, Peshawar, Quetta and Islamabad have been considered as Large Sized Cities. Each of these cities constitutes a separate stratum which has been further sub-stratified according to low, middle and high income groups based on the information collected in respect

of each enumeration block at the time of demarcation/updating of urban area sampling frame.

ii. **Remaining Urban Areas**

After excluding the population of large sized cities from the population of respective administrative district of a province, the remaining population of cities/towns of an administrative division has been grouped together to form a stratum called other urban. Thus each division in remaining urban areas in the four provinces constitutes a stratum.

**Rural Domain**

3 In rural domain, each district in the Punjab, Sindh and NWF Provinces has been considered as independent and explicit stratum whereas in Balochistan Province each administrative division constitutes a stratum.

**Sample Size and Its Allocation**

4. Considering the variability of the characteristics for which estimates are to be prepared, population distribution and field resources available a sample size of about 31680 sample households (SSUs) have been considered appropriate to provide reliable estimates of key National and Provincial level with expected reliability within 5% coefficient of variation at 95% degree of confidence. The entire sample households (SSUs) have been drawn from 704 Primary Sampling Units (PSUs) out of which 308 are urban and 396 are rural. As urban population is more heterogeneous therefore, higher proportion of sample PSUs has been assigned to urban domain. Similarly NWFP and Balochistan being the smaller provinces and to get their reliable estimates, higher proportion of sample has also been assigned to these provinces. After fixing the sample size at provincial level, further distribution of sample PSUs and SSUs to different strata in rural and urban domains in each province has been made proportionately, keeping in view the minimum requirement of each stratum.

The distribution of sample PSUs and SSUs in the urban and rural domain of the four provinces:-

PROVINCE	Number of Primary Sampling Units Covered During 2007			Number of Sample Household Covered During 2007		
	Total	Urban	Rural	Total	Urban	Rural
Pakistan	704	308	396	31565	13775	17790
Punjab	364	158	206	16296	7043	9253
Sindh	160	80	80	7194	3595	3599
NWFP	112	42	70	5019	1880	3139
Balochistan	68	28	40	3056	1257	1799

Note: 115 sample households (SSUs) have not been covered due to certain reasons.

### **Sample Design:**

5 A stratified two-stage sample design has been adopted for the survey.

### **Selection Procedure**

a. **Selection of Primary Sampling Units (PSUs):** Enumeration blocks in urban domain and mouzas/dehs/villages in rural domain have been taken as primary sampling units (PSUs). In the urban domain, sample PSUs from each ultimate stratum/sub-stratum have been selected with probability proportional to size (PPS) method of sampling scheme. In urban domain, the numbers of households in enumeration block as per Economic Census 2003-04 and population of village/deh/mouza/ according to population census 1998 have been considered as measure of size.

b. **Selection of Secondary sampling Units (SSUs):** Household within sample PSUs have been taken as secondary sampling units (SSUs). A specified number of households i.e. 45 from each urban and rural sample PSU have been selected with equal probability using systematic sampling technique with a random start.

### **Estimation Procedure**

Estimation Procedure and formulae based on two-stage stratified sample design has been developed.

## METHODOLOGY OF DATA COLLECTION

### Listing Operation—Rural Areas

Village/ mouza /deh (as defined and published by the population census organization in the 1998 Census) constituted the primary sampling unit (PSU) in each rural stratum. List of selected PSUs was supplied to the field staff by the headquarter.

2. Boundaries of the selected village/mouza/deh were identified by the enumerators with the help of revenue staff i.e. patwari, qanoongo, etc. Information regarding location of the village, its boundary, description and means of approaching the village, etc. was obtained by the field staff through personal visits.

3. Two types of maps, sketch and detailed maps, were prepared for each village/mouza/deh. The sketch map shows its general location and outer boundaries. The detailed map of the village/mouza/deh has been prepared by the Enumerator with the help of revenue map, where such maps are available with the revenue authorities or Directorate of Land Records, incase revenue map is not available, then enumerator has prepared its own map demarcating clearly the boundaries of the area showing important land marks such as mosques, schools, shops, hospitals, etc. Detailed instructions and guidelines in this respect have been provided to the field staffs by headquarter.

4. Household listing and numbering of structures were carried out simultaneously. All the structures in the selected village/mouza/deh were serially numbered, starting from a prominent mark. This number was written clearly at a prominent place of the structure. In order to distinguish this number from other number on the structure, the letter 'PD' preceded it, for instant, PD-12, PD-432, etc. Each structure number was shown at the appropriate place in the detailed map. After the completion of household listing, in the selected village /mouza /deh, 45 households were randomly selected from it. Identification particulars of the

sample areas, serial number of structures, and serial number of households and names of the head of households are copied in the PDS-5 form.

### **Listing Operations—Urban Areas**

5. City/Town in each province has been divided by the field staff of the Federal Bureau of Statistics into Enumeration Block (EB), each block comprises about 200 to 250 households. An Enumeration Block has been taken as a PSU. List of the selected PSUs along with their identification in terms of Enumeration Block codes was supplied to the field staff by the headquarter. Maps of these Enumeration Blocks already prepared at the time of demarcation/updating however, same are updated in case of new structures in any Enumeration Block. Household listing and structure numbering is carried out simultaneously.

### **Training of Field Staff**

6. Regular field staff of the Federal Bureau of Statistics posted at Regional and field offices through out the country are utilized for the survey. Majority of the field enumerators and supervisory staff engaged in PDS work possessed long experience of surveys, including demographic surveys. However, training of the field staff was arranged in selected field offices, including the staff of other field offices of the nearest districts. Extensive training for filling the schedules was imparted to all enumerators and supervisors. Besides the emphasis was laid on the objectives of the survey, definitions of the terms used in the schedules, probing methods to achieve the correct information of vital events.

7. A Manual of Instructions for the enumerators and supervisory staff was developed and provided to the field staff. This Manual also contained detailed procedure for the collection of information on birth and death events and other demographic characteristics with a reference period of last 12 months (from 1<sup>st</sup> January to 31<sup>th</sup> December, 2007) in January 2008 round.

## **Survey Methodology**

8. In the previous surveys the methodology was used to collect, birth and death events on quarterly basis with a reference period of last six calendar months, providing an overlap period of three months. Birth and death events of overlapping period were matched on case to case basis and non-matched events were through field visits.

9. Reports of the PGE 1962-65, PGS 1968-71, PGS 1976-79 and PDS 1984-2005 have already been published and their detailed survey methodologies have been described in these reports. The PDS-2006 report could not be published due to some administrative reasons and it has been placed on FBS web site. In PDS-1999, PDS-2000, PDS-2001, PDS-2003 , PDS-2005 to PDS-2007, a new methodology has been introduced and justification for using the same is given below: -

### **Justification for Using New Methodology**

10. The experiences of previous methodologies revealed that much time and cost were involved in matching of birth and death events on case to case basis for overlapping period and non-matched events through field reconciliation which also caused delay in publishing the important demographic indicators in time. Due to time lag these indicators were of no use for policy makers, researchers and scholars.

11. In order to minimize the time-lag and release the findings of the survey well in time, a one time survey with slightly changed methodology was adopted and tested for PDS-1999 with a reference period of last 12 months (i.e. 01-01-1999 to 31-12-1999). Instead of forming clusters, 45 households were randomly selected directly from PSUs. Births and deaths for the same period were recorded on PDS-3 and PDS-4 forms respectively. In PDS-2000, the survey was conducted in two phases with the same methodology adopted in 1999. In phase-I (July round), the reference period was from first January 2000 to 30th June 2000. In phase-II (January round), the reference period was taken from 1<sup>st</sup> July 2000 to 31<sup>st</sup>

December 2000. The births and deaths collected from these two rounds were combined. In PDS-2003, the methodology adopted in PDS- 1999 has been used. In January 2004, the births and deaths are enumerated with a reference period of last 12 months. The population was enumerated as on 1<sup>st</sup> January 2004. This methodology of data collection is considered best for better findings of the survey well in time for the users and planners. In PDS-2007, the reference period was the last 12 months i.e. from 01-01-2007 to 31-12-2007. The population was enumerated as on 1<sup>st</sup> January 2007.

12. The methodology adopted in the PDS-2007 is described below: -

### **Population Coverage**

13. In the PDS 2007, the coverage of the population is on de jure basis i.e. all persons who usually live in the sample areas, whether present or temporarily absent at the time of enumeration (night prior to the date of enumeration) are included in the survey. On the other hand any person who was present in the sample areas (night prior to the date of enumeration) but whose usual residence is out of the sample areas, is not enumerated in the survey. Students who are studying in any other village/town but living in the hostels or boarding houses are enumerated with their parent's household. However, if any such student is living with his relatives, friends or in a private house, then he is enumerated at the place where he is being studied. Population of institutions, such as patients admitted in the hospitals, inmates of prison houses are not covered. Instead, they are enumerated with their usual households, provided their period of absence is not more than six months.

14. The details of persons included and excluded in the survey are given below:

Persons Included	Persons Excluded
<p>a) All persons usually residing in households in the sample area and found at their residence last night.</p> <p>b) All usual members of households in the sample area who were temporarily absent last night due to vacation, visiting friends and relatives, on business, getting education in another village, town or city and were living in hostels, boarding houses, etc.</p> <p>c) A person found at his place of business within the sample area, provided it is his usual residence also.</p> <p>d) Persons (friends, relatives, etc.) who have come in the sample area from outside to acquire education and were staying with the households or in a separate house but not in hostel or boarding house.</p> <p>e) Persons who were temporarily admitted to a hospital for medical treatment.</p> <p>f) Married daughters whose husbands are in military service or working in a distant place but who have usual residents of sample households.</p> <p>g) Servants, who used to sleep and take meals in the sample households.</p> <p>h) Household member who are in jail and convicted for a period of less than six months or whose cases are not yet decided.</p>	<p>a) All persons who spent last night in sample households but were not usual members of those households. These might be relatives, friends, visitors, guests, etc</p> <p>b) Person who were residing in the premises of a foreign embassy.</p> <p>c) Person living in military barracks and other security or prohibited areas.</p> <p>d) Persons living in boarding houses, hostels that were located in the sample area.</p> <p>e) Married daughters who are temporarily residing in the parent's home for delivery of an expected birth or on a short visit.</p> <p>f) Persons who usually live at the place of their work but returned to their family on week-ends or during holidays.</p>

## **Coverage of Birth and Death Events**

15. Birth and death events which occurred to the usual members of the selected household are enumerated one time with a reference period of last 12 calendar months (i.e.01-01-2007 to 31-12-2007) in January-March 2008 visit.

16. For each live birth, which occurred to a usual household member during the reference period i.e. from 1<sup>st</sup> January 2007 to 31<sup>st</sup> December 2007, a “Birth Enumeration Form” is filled-in. This form contains the information about the newborn, such as sex, date of birth, whether or not birth has occurred in any medical institution, type of medical attendant at the time of birth, etc. It has also records of certain particulars of the parents. Similarly, for each death which occurred to a usual member of the sample household during the reference period i.e.01-01-2007 to 31-12-2007, a “Death Enumeration Form “ is filled-in.

## FINDINGS OF THE SURVEY

### Demographic Characteristics

Although the main objective of the Pakistan Demographic Survey (PDS) is to collect data on birth and death events, information on important demographic characteristics of the sample population, such as age, sex, marital status, literacy and educational level are also collected in the PDS 2007. Summary of the main findings based on this information is given in the subsequent paragraphs.

### Coefficient Of Variations

2. The Coefficient of Variation of important Demographic Indicators have been computed from PDS data which is given below.

**Table No. 4.1: Coefficient Of Variation Of Important Indicators**

NAME OF DEMOGRAPHIC INDICATORS	COEFFICIENT OF VARIATION
SEX RATIO	0.05
HOUSEHOLD SIZE	0.44
CRUDE BIRTH RATE	1.79
CRUDE DEATH RATE	3.79
NATURAL GROWTH RATE	2.19

### Age Data

3. Data on age is obtained in completed years. For persons aged one year or over, the age is recorded in completed years; for children of one month and over but less than one year, in completed months and for babies less than one month, it is recorded in days only.

### Age Misreporting

4. Data on age in developing countries are subject to errors. Given the importance of correct age reporting, efforts are therefore, made to obtain correct information on age. This point is greatly stressed in the training sessions of

enumerators. Numerous suggestions for eliciting accurate age from the respondents are also incorporated in the Manual of Instructions for the field enumerators.

5. Despite best efforts, age misreporting is quite common due to low literacy level in the country .A common error in the age reporting is the tendency of rounding the ages to the nearest figure ending in '0' or '5'or to a lesser extent, in even number. Because of this tendency, commonly known as “digital preference”, age heaping occurs at certain ages.

### Whipple Index

6. Whipple’s Index is a very effective measure of age accuracy so far as digit preference is concerned and has the advantage that it can be compared easily. It measures the preference for two digits ending 0 and 5.

**Table No. 4.2: Whipple Index By Urban And Rural Areas**

SURVEY/CENSUS	WHIPPLE INDEX					
	ALL		URBAN		RURAL	
	Male	Female	Male	Female	Male	Female
PDS- 2007	191.5	179.0	181.9	178.8	197.0	179.1
PDS- 2006	195.0	185.9	179.1	175.7	203.4	190.9
CENSUS- 1998	172.5	200.9	150.8	175.9	185.4	213.8

7. The Whipple Indices of PDS Survey and Census 1998 show high degree of age heaping. The indices show that in PDS males have higher tendency of age heaping than females.

8. Table 4.3 shows the percentage distribution of population by age and sex based on PDS and population census 1998.

**Table No. 4.3: Percentage Distribution of Population by Broad Age Groups and Sex**

SURVEY/CENSUS	TOTAL	UNDER 15 YEARS	15-64 YEARS	65 YEARS AND ABOVE
<b>MALE</b>				
PDS -2007 a/	100.0	41.8	54.6	3.6
PDS -2006 a/	100.0	42.2	53.9	3.9
CENSUS -1998 b/	100.0	43.1	53.3	3.6
<b>FEMALE</b>				
PDS-2007 a/	100.0	41.4	55.6	3.0
PDS-2006 a/	100.0	40.9	56.0	3.1
CENSUS-1998 b/	100.0	43.3	53.5	3.2

**Note:** a =Survey data refers only to Survey Universe.

b =Census data excludes the population of Federally Administered Tribal Areas (FATA), Military Restricted areas, Kohistan areas of Hazara Division and provincially Administered Tribal Areas (FATA).

9. The above table shows that in PDS-2007, the proportion of children under 15 years is 41.4 percent for females and 41.8 percent for males. The census figure of 1998 indicates slightly higher share i.e. 43.3 and 43.1 percent respectively. This decline in less than 15 years population indicates a decline in fertility in the country since 1998. The proportion of old persons (65 years and over) is quite low. Only about 3 to 4 percent of population falls in this age group.

### **Dependency Ratio**

10. Dependency ratio, defined as the proportion of children under 15 years and old persons aged 65 year and above to the population between 15 to 64 years, reflects the burden on economically active population. Table 4.4 indicates dependency ratio as obtained from PDS-2007, PDS-2006 and population census of 1998.

**Table No. 4.4: Dependency Ratios for Pakistan and Provinces**

PROVINCE	DEPENDENCY RATIOS		
	PDS-2007	PDS-2006	CENSUS-1998
Pakistan	81.5	82.0	87.3
Punjab	77.2	78.2	85.6
Sindh	80.9	79.7	83.4
NWFP	91.5	94.4	100.3
Balochistan	107.3	103.6	95.9

11. Compared with some other countries, both developed and developing, dependency ratios particularly youth dependency ratio (proportion of children less than 15 year to the population 15-64 years) is very high in Pakistan. Dependency ratios are higher in NWFP and Balochistan as compared to Sindh and Punjab during 2007 which may be due to high household size. The same pattern was observed in the census of 1998.

### **Sex Ratio**

12. Sex ratio at birth has been recorded as 110 for PDS 2007. Sex ratio at birth is high in rural areas as compared to urban areas. An analysis of data during 1951-2007 indicates that overall sex ratio has been steadily declining in Pakistan since the first population Census in 1951. This can be attributed to relatively faster decline in the female mortality due to improved health facilities, availability of vaccine for various diseases and better female coverage in the censuses and surveys. In PDS 2007, the overall sex ratio is 105. The sex ratio for urban areas is higher as compared to rural areas (table 4.5).

**Table No. 4.5: Sex Ratio by Urban and Rural Areas**

SURVEY/CENSUS	SEX RATIO		
	All Areas	Urban Areas	Rural Areas
PDS-2007	105	106	105
PDS-2006	106	107	105
CENSUS-1998	108	112	106

## Household Size

13. A household in the PDS 2007 is defined to be constituted of all those persons who usually live together and share their meals. A household may consist of one person or more than one person who may or may not be related to each other.

14. The average household size as obtained from the PDS 2007 is 6.6 (table 4.6). This is about 2 percent lower as reported in PDS-2006 and 3 percent lower in the census 1998. This household size is larger in rural areas than in urban areas in Sindh and NWFP while the household size is larger in urban areas of Punjab and Balochistan in the year 2007.

**Table No. 4.6: Average Household Size by Province & Urban-Rural Residence**

A R E A	PDS-2007	PDS-2006	CENSUS-1998
<b>PAKISTAN</b>	6.6	6.7	6.8
URBAN	6.6	6.5	7.0
RURAL	6.7	6.8	6.8
<b>PUNJAB</b>	6.4	6.4	6.9
URBAN	6.5	6.4	7.1
RURAL	6.4	6.5	6.9
<b>SINDH</b>	6.5	6.6	6.0
URBAN	6.4	6.5	6.8
RURAL	6.6	6.6	5.5
<b>NWFP</b>	7.7	7.9	8.0
URBAN	7.5	7.6	7.9
RURAL	7.7	7.9	8.0
<b>BALUCHISTAN</b>	7.4	7.1	6.7
URBAN	7.7	7.2	7.8
RURAL	7.4	7.0	6.4

15. Percentage distribution of households by number of persons separately for urban and rural areas for the year 2007 is given in table 4.7. This table shows that

the share of single person's household is 1 percent. The household with 5 or less persons has been constituted about 38 percent of the total households in the survey of PDS-2007, while 39 percent in urban areas and 37 percent in rural areas have been constituted in PDS-2007 respectively. The households constituting 10 or more members covered in the survey are 13 to 14 percent.

**Table No. 4.7: Percentage Distributions of Households by Number of Persons and Urban-Rural Residence**

Data Source/Areas	All House Holds	Percentage Distribution of Households by Number of Persons									
		1	2	3	4	5	6	7	8	9	10+
<b>PDS-2007</b>											
All Areas	100.0	1.1	4.9	7.2	10.8	13.9	15.2	13.8	11.0	8.0	14.0
Urban Areas	100.0	1.1	4.5	6.8	11.2	15.3	15.9	14.0	10.4	7.4	13.4
Rural Areas	100.0	1.0	5.2	7.4	10.6	13.1	14.9	13.7	11.4	8.4	14.3
<b>PDS-2006</b>											
All Areas	100.0	1.2	4.8	7.2	10.7	13.9	15.3	13.7	10.7	7.7	14.8
Urban Areas	100.0	1.3	4.7	6.7	11.4	15.6	16.6	13.5	9.8	6.9	13.6
Rural Areas	100.0	1.1	4.8	7.5	10.4	12.9	14.5	13.8	11.3	8.1	15.5
<b>1998 CENSUS</b>											
All Areas	100.0	2.8	7.6	8.0	9.8	11.6	12.8	11.4	9.7	7.7	18.6
Urban Areas	100.0	3.1	5.9	7.2	9.6	12.0	13.6	11.4	9.7	7.6	19.9
Rural Areas	100.0	2.8	8.4	8.3	9.9	11.3	12.4	11.1	9.8	7.8	18.2

### **Marital Status**

16. Age at first marriage and proportions of never married are among the important determinants of fertility in a population. Data on marital status is collected according to classification of never married, married, widowed, divorced and separated. A simple but important distribution of population by marital status is obtained by grouping the population into two broad marital status categories, never-married and ever-married by age and sex. For the age group 15-49 (after 49 only a small proportion of both sexes remain never-married), percentage of never-married by age both for males and females are given for the PDS-2007 in Table No. 4.8.

**Table No. 4.8: Percentages of Never Married by Sex and Age Groups**

SEX/AGE GROUP [YEARS]	PDS-2007	PDS- 2006	CENSUS 1998
<b>MALE</b>			
15-19	97.7	97.6	93.7
20-24	78.6	77.8	70.1
25-29	38.7	38.2	38.4
30-34	13.0	13.0	16.9
35-39	4.0	4.4	8.3
40-44	2.1	2.1	5.5
45-49	1.5	0.9	3.9
<b>FEMALE</b>			
15-19	89.2	88.9	78.9
20-24	47.4	47.1	38.8
25-29	13.8	14.5	14.8
30-34	4.2	4.2	7.1
35-39	1.9	1.9	4.3
40-44	1.7	1.3	3.4
45-49	1.0	1.0	2.5

17. The above table indicates that in case of female, 1 percent remains unmarried whereas 1.5 percent of male is unmarried in the age group 45-49 years in 2007 survey. It shows that marriage is almost universal in Pakistan for males and females.

18. The rising proportion of never-married are observed among the age groups 15-19 to 25-29 years particularly for males while the same trend can be observed for females of age group 15-24. It indicates pattern of increase for age at first marriage. In PDS 2007, 89 percent females in the age group 15-19 are single as compared to 25 percent in the 1961 population census indicates more than 3 fold increase in 47 years.

19. Comparing the proportion of never married females by age for various data sources, it is evident that the age at marriage has increased. For instance, the proportions of never-married females in the age group of 15-19 years has been increased about 13 percent in 2007 as compared to 1998 population census.

Similarly, the percentage share of never- married females in the age group of 20-24 years has also been increased by 22 percent for the same period. When compared with 1998 Census the corresponding proportions of these age groups for males also shows an increase of 4 percent and 12 percent respectively.

20. Table No. 4.9 gives singulate Mean Age at Marriage calculated from the proportions of single up to age 50 years because the proportion for unmarried after 50 years is negligible to enter the wedlock for the first time.

**Table No. 4.9: Singulate Mean Age At Marriage By Sex**

SURVEY/CENSUS	MALE [YEARS]	FEMALE [YEARS]
PDS-2007	26.4	22.8
PDS-2006	26.5	22.7
CENSUS-1998	25.8	21.7

21. An analysis of data from 1961 to 2006 indicates an increasing trend for singulate mean age at marriage for both sexes. The age at marriage for males from 23.3 years in 1961 has risen to 26.4 years in 2007, similarly for females, the age at marriage has been increased from 16.7 to 22.8 years during the same period. This increasing trend in age at marriage would contribute in fertility reduction in the country.

### **Fertility**

22. Data on birth events are collected through January 2008 visits by asking retrospective questions with a reference period of last 12 months (i.e. from 1<sup>st</sup> January to 31<sup>st</sup> December 2007). If a live birth has occurred to a usual member of the household in-or out-side the sample household, particulars of the child and those of the parents of the child are recorded in PDS-3 Form.

## Crude Birth Rate

23. Crude Birth Rate (CBR) is the simple way of measuring current fertility level in any population. It is defined as the number of births in a year per 1000 (mid-year) population. The crude birth rate as obtained from the PDS 2007 is 25.6 per 1000 persons.

24. Table 4.10 indicates that rural-urban differentials exist in the fertility level; rates for rural areas are higher than those of urban areas in both the surveys. The crude birth rate is about 14 percent higher in rural areas as compared to urban areas. The crude birth rate has declined 24 percent during the last 11 years, as it was 33.8 in 1997.

**Table No. 4.10: Crude Birth Rate by Urban/Rural Residence**

SURVEY	CRUDE BIRTH RATE		
	All Areas	Urban Areas	Rural Areas
PDS-2007	25.6	23.4	26.7
PDS-2006	25.9	23.4	27.2

## General Fertility Rate

25. Crude Birth Rate (CBR), though a very useful index of measuring fertility, is subject to a number of limitations, as it includes certain segments of population in the denominator that are not “exposed to risk” of child-bearing. Another important summary measure of fertility level is the general fertility rate (GFR), defined as the number of births in a year per 1000 women of child-bearing ages (i.e. females of ages 15-49 years). It is a refined method to measure fertility as compared to crude birth rate. Table 4.11 shows the general fertility rates as obtained from PDS 2007 and 2006. Area wise comparison indicates that general fertility rates are higher (about 27 percent) in rural areas as compared to urban areas of the country. The general fertility rate has declined 29 percent as compared to 152.8 in 1997.

**Table No. 4.11: General Fertility Rate by Urban/Rural Residence**

SURVEY	GENERAL FERTILITY RATE		
	All Areas	Urban Areas	Rural Areas
PDS-2007	108.0	92.1	117.7
PDS-2006	108.8	90.6	120.1

**Age Specific Fertility Rate**

26. Age specific fertility rate is more refined way to measure fertility trends. In general, fertility is comparatively low among women of ages less than 20 years and after 39 years. It is concentrated at the ages 20-39 years as shown in table 4.12 and figure 4.1.

**Table No. 4.12: Age Specific Fertility Rate (Per 1000 Women) By Urban-Rural Residence Pakistan**

AGE GROUP	PDS – 2007			PDS – 2006		
	All Areas	Urban Areas	Rural Areas	All Areas	Urban Areas	Rural Areas
15-19	16.1	9.2	20.5	18.1	10.1	23.3
20-24	150.0	119.0	170.6	149.8	118.7	170.7
25-29	225.3	219.9	228.4	225.8	209.6	235.3
30-34	173.3	166.1	177.2	176.6	164.6	183.3
35-39	102.6	79.2	116.4	107.7	92.6	116.8
40-44	52.6	32.3	64.5	53.6	25.7	71.2
45-49	18.0	12.4	21.6	15.6	9.0	19.7

27. From the above table it is quite visible that the age specific fertility rate raises sharply for age group 20-24 years and reaches the peak in the age group 25-29 years, then declines slowly up to age 35-39 years and rapidly in the age groups 40-44 and 45-49 years. This trend can be observed in both urban and rural areas of the country.

28. Table No. 4.12 shows the age specific fertility rates for PDS 2007 and 2006. It may be noticed that in both the surveys the modal age group was 25-29 years.

29. Table No. 4.13 indicates that 2 to 4 percent births are contributed by the women below the age of 20 years and 1 to 5 percent of births has occurred to women of the ages 40 years and above in the survey of 2007. The women aged 20-39 years has been contributed about 89 to 93 percent births. The percentage contribution of births is higher in urban areas than in rural areas in the age group of

25-34 years. The percentage distribution of births contributed by age group 15-24 years is higher in rural areas than in urban areas, which show the traditionally early marriages in the rural females.

**Table No. 4.13: Percentage Distribution of Births by Age of Mother and Urban-Rural Residence**

SURVEY	AGE GROUP [YEARS]							
	TOTAL	15-19	20-24	25-29	30-34	35-39	40-44	45-49
<b>PDS-2007</b>								
All Areas	100.0	3.5	26.4	32.7	20.2	11.3	4.5	1.4
Urban	100.0	2.4	25.9	36.3	21.1	10.0	3.2	1.1
Rural	100.0	4.0	26.6	31.0	19.8	11.9	5.1	1.6
<b>PDS-2006</b>								
All Areas	100.0	3.8	26.4	32.6	19.8	11.5	4.6	1.3
Urban	100.0	2.6	26.4	34.8	20.9	11.7	2.7	0.9
Rural	100.0	4.4	26.4	31.5	19.3	11.4	5.5	1.4

## Age Specific Marital Fertility Rate

30. Age specific marital fertility Rate (ASMFR) is an advance step in the analysis of fertility levels. Married females in any age group in the reproductive period constitute the population actually exposed to the risk of childbearing as all reported births in PDS has occurred to married women only. In the age group 45-49 years about one percent women remain never married.

31. Table 4.14 indicates that ASMFR is raised sharply after age group 15-19 years in the next group to the maximum value in the age group 20-24 years then declines gradually in the next age groups and rapidly after age group 35-39 years. This pattern is also followed in the urban and rural areas in PDS-2007. Here the model age group is 20-24 years.

**Table No. 4.14: Age Specific Marital Fertility Rate (Per 1000 Currently Married Women) By Urban-Rural Residence**

AGE GROUP [YEARS]	PDS – 2007			PDS-2006		
	All Areas	Urban Areas	Rural Areas	All Areas	Urban Areas	Rural Areas
15-19	149.9	154.4	148.7	164.0	160.3	165.0
20-24	287.3	299.6	282.0	285.8	306.3	277.1
25-29	264.4	277.1	257.8	267.6	268.8	267.1
30-34	184.2	179.5	186.7	187.8	178.5	193.0
35-39	107.4	83.5	121.1	113.4	98.5	122.2
40-44	56.2	35.0	68.4	57.5	28.2	75.5
45-49	19.9	13.7	24.0	17.5	10.4	21.6

## Total Fertility Rate

32. Total Fertility Rate (TFR) is one of the summary measures of current fertility level. It indicates the number of children to be born to a woman during her reproductive span of life. The advantage of this measure is that it is less influenced

by the age structure of the population. The TFR depicted by the PDS 2007 and 2006 is given in Table No. 4.15.

**Table No.4.15: Total Fertility Rate By Urban-Rural Residence**

SURVEY	TOTAL FERTILITY RATE (PER WOMAN)		
	All Areas	Urban Areas	Rural Areas
PDS-2007	3.7	3.2	4.0
PDS-2006	3.7	3.2	4.1

33. TFR in urban areas is lower than that in rural areas in both surveys. Total fertility rate has also declined from 5 children per woman to 4 children per woman during the period 1997 to 2007.

### **Mortality**

34. Information on death events is obtained through January, 2008 visit with a reference period of last 12 months (e.g., 1<sup>st</sup> January to 31<sup>st</sup> December, 2007). In case of the death of usual member of the household during the reference period, detailed information in respect of the deceased is recorded in PDS-4 Form.

### **CRUDE DEATH RATE**

35. Crude death rate (CDR) i.e. deaths per 1000 persons as obtained from PDS 2007 and 2006 for Pakistan with urban-rural breakdown is given in Table No. 4.16.

**Table No. 4.16: Crude Death Rate By Urban-Rural Residence**

SURVEY	CRUDE DEATH RATE								
	ALL AREAS			URBAN AREAS			RURAL AREAS		
	BOTH SEXES	MALE	FEMALE	BOTH SEXES	MALE	FEMALE	BOTH SEXES	MALE	FEMALE
PDS-2007	6.8	7.8	5.8	5.4	6.7	4.1	7.5	8.4	6.6
PDS-2006	7.0	7.6	6.3	5.8	6.6	4.9	7.6	8.1	7.0

36. The Crude death rate obtained from the PDS 2007 is 6.8 per thousand persons for Pakistan. The crude death rate is lower in urban areas than in rural

areas in both the surveys. The crude death rate has slightly declined from 7.0 in 2006 to 6.8 per thousand in 2007. Females have lower death rate than males in all the areas.

### Sex And Age Specific Mortality Rate

37. The impact of mortality on various age groups is not evenly distributed. The age curve of mortality (figure 4.3) is bimodal i.e., it has two peaks. The Age specific Death Rate (ASDR) starts at a very high peak immediately after birth, declines to a minimum value for the young age population (5-14 years), rises gradually among the age groups 15-49 years and then rapidly at the advanced ages. This pattern has been observed both for males and females in both the surveys (Table-4.17). The child mortality 0-4 (years) is very high in Pakistan i.e. about 36 percent of the total deaths.

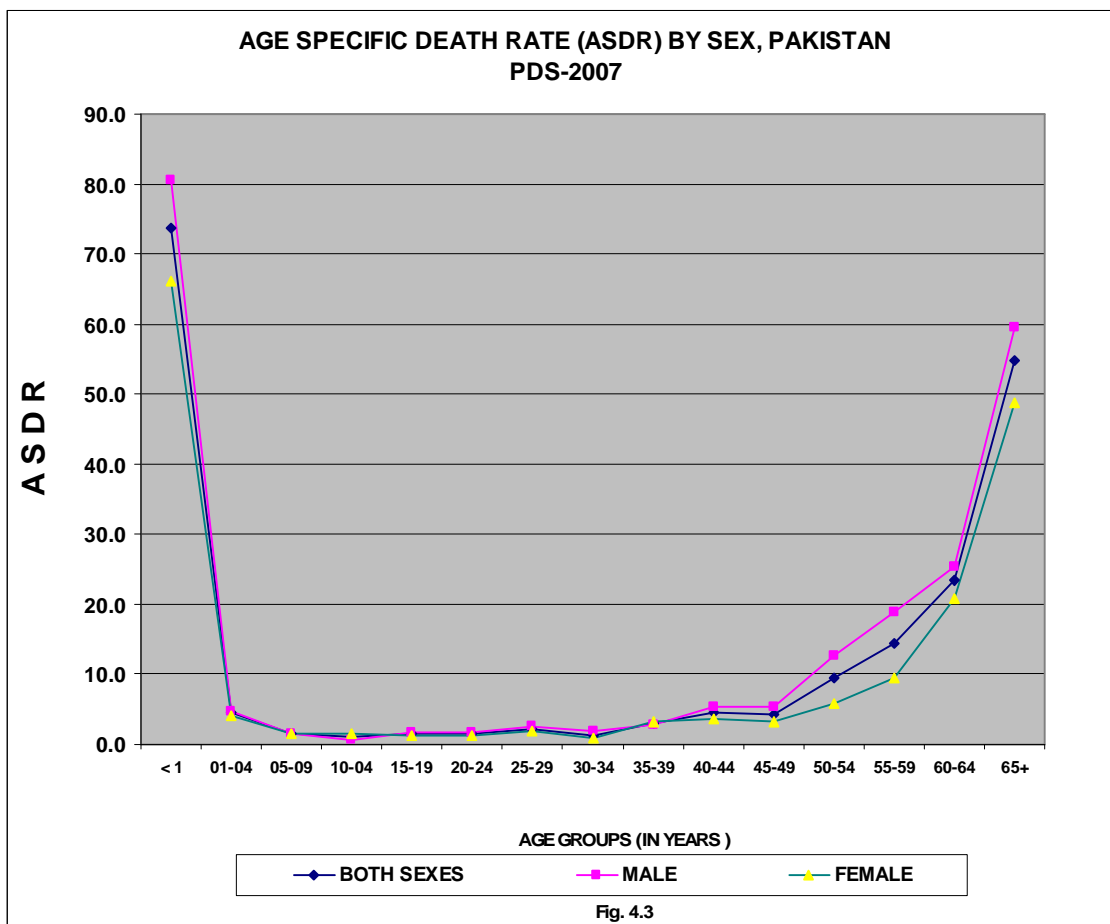

**Table No. 4.17: Age Specific Death Rate by Sex, Pakistan**

AGE GROUP [YEARS]	PDS-2007			PDS-2006		
	BOTH SEXES	MALE	FEMALE	BOTH SEXES	MALE	FEMALE
ALL AGES	6.8	7.8	5.8	7.0	7.6	6.3
BELOW-1	73.7	80.6	66.2	74.2	92.8	56.5
01-04	4.4	4.8	4.1	7.0	6.8	7.2
05-09	1.5	1.4	1.5	1.8	1.6	1.9
10-14	1.0	0.6	1.4	1.1	1.1	1.2
15-19	1.6	1.8	1.3	1.3	1.5	1.0
20-24	1.5	1.6	1.3	1.8	1.6	2.0
25-29	2.2	2.5	2.0	1.8	2.1	1.5
30-34	1.4	2.0	0.8	2.6	2.9	2.3
35-39	3.0	2.8	3.2	3.0	3.3	2.7
40-44	4.6	5.4	3.7	3.3	3.5	3.1
45-49	4.4	5.5	3.2	3.8	3.8	3.8
50-54	9.5	12.7	5.8	7.4	7.0	7.9
55-59	14.4	18.8	9.5	10.9	10.8	11.1
60-64	23.4	25.3	20.9	16.9	17.0	16.7
65+	54.8	59.5	48.9	57.4	57.2	57.6

38. The urban and rural differentials also depict the socio-economic development and medical facilities available in urban areas.

39. Females have higher chances of survivorship in all countries of the world, with only a few exceptions. In the past female life expectancy was lower than that of males in Pakistan. However, at present the universal pattern has been observed in Pakistan, i.e. female life expectancy is higher than male life expectancy.

40. Females have lower death rates than the males for most age groups except some ages 05-14 and 35 - 39. The age specific mortality rates by age and sex are graphically shown in fig. 4.3 for PDS 2007.

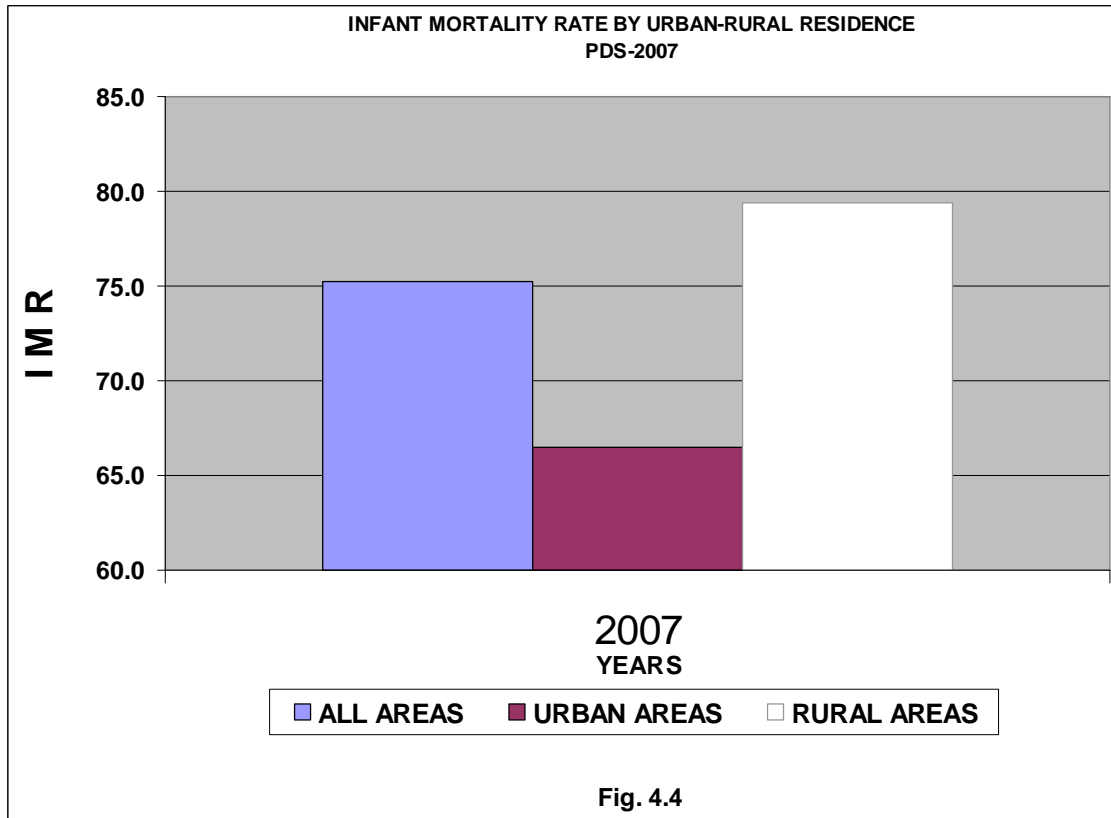

## Infant Mortality Rate (IMR)

41. Infant Mortality Rate (IMR) measures the mortality below one year of age. It is defined as the number of infant deaths during a calendar year per 1000 live births in the same year. Infant mortality is an important indicator to judge socio-economic conditions, cultural factors, status of hygiene and availability & utilization of medical services.

42. Table No. 4.18 exhibits the Infant mortality rates as obtained from PDS 2007 and 2006. Infant mortality rate has been declining in Pakistan but it is still high. The infant mortality rate has slightly declined about 1 percent in 2007 as compared to 2006.

**Table No. 4.18: Infant Mortality Rate By Urban-Rural Residence**

SURVEY	INFANT MORTALITY RATE								
	ALL AREAS			URBAN AREAS			RURAL AREAS		
	BOTH SEXES	MALE	FEMALE	BOTH SEXES	MALE	FEMALE	BOTH SEXES	MALE	FEMALE
PDS-2007	75.2	83.5	66.2	66.5	74.9	57.6	79.4	87.4	70.4
PDS-2006	76.2	91.6	60.2	66.4	75.9	56.2	80.7	99.1	62.0

43. Infant mortality rates are much higher (about 19 percent) in rural areas than in urban areas where better neo-natal and post-natal facilities are available. Male Infant mortality rate is higher than female infant mortality rate in all areas

### Neo-Natal And Post-Neo-Natal Mortality Rates

44. Mortality during the first year of life is divided into two main period's i.e.
- i. Neo-natal Mortality occurring within the first month and,
  - ii. Post-neonatal mortality occurring during the remaining 11 months.
45. This distinction is useful as the causes as well as the levels of mortality are quite different in these two periods. Table 4.19 and figures 4.5 show that mortality within the first month after birth is very high in 2007.

**Table No. 4.19: Neo-Natal and Post Neonatal Mortality Rates Per 1000 Live Births] by Urban–Rural Residence**

SURVEY	ALL AREAS		URBAN AREAS		RURAL AREAS	
	Neo-Natal Mortality	Post Neo-Natal Mortality	Neo-Natal Mortality	Post Neo-Natal Mortality	Neo-Natal Mortality	Post Neo-Natal Mortality
PDS-2007	44.1	31.1	38.8	27.7	46.6	32.8
PDS-2006	39.4	36.8	35.8	30.6	41.1	39.6

46. Like crude death rates and infant mortality rates, the PDS-2007 data indicates that the neo-natal mortality in rural areas is about 20 percent higher than in the urban areas.

### Maternal Mortality Rate (MMR)

47. Maternal Mortality rate (MMR) measures approximately the risk of dying as a result of complications of pregnancy, child birth and the puerperium.

**Table No.4.20: Maternal Mortality Rate By Urban-Rural Residence**

SURVEY	MATERNAL MORTALITY RATE		
	ALL AREAS	URBAN AREAS	RURAL AREAS
PDS-2007	254	112	314
PDS-2006	318	131	391

48. The maternal mortality rate as obtained from PDS 2007 is 254 per 100,000 live births. Maternal Mortality Rate is high in rural areas in both surveys compared to urban areas which is due to better medical facilities available in urban areas.

### **Natural Growth Rate**

49. The natural growth rate as depicted from PDS 2007 is 1.88 percent (Table 4.21). The growth rate has declined about 1 percent in 2007 as compared to 2006. High natural growth rate during the last few decades is the result of a steadily declining trend in mortality with only moderate decline in fertility. With this high growth rate, the population of the country will be doubled in 37 years.

**Table No. 4.21: Birth Rates, Death Rates and Natural Rates of Increase**

SURVEY	BIRTH RATE [PER 1000 PERSONS]	DEATH RATES [PER 1000 PERSONS]	NATURAL RATE OF INCREASE [PERCENT]
PDS-2007	25.6	6.8	1.88
PDS-2006	25.9	7.0	1.89

### **Life Expectancy**

50. The life expectancy at birth is a summary measure Index that is obtained from a life table. It shows the average number of years that persons can expect to live from the time of birth if they experience currently prevail the age specific death rates throughout their life. The expectation of life at birth is independent of the age structure of a population and therefore provides a more reliable index for international comparisons of the level of mortality, social and economic condition of a country.

51. From the Life Table of PDS 2007, it depicts that the expectancy of life at birth of males and females in Pakistan are 64 and 68 years respectively.

**TABLE: 4.22 ABRIDGED LIFE TABLE PDS-2007**

**MALE**

PART-1 PARTICULARS OF CHILD

PART-11 PARTICULARS OF MOTHER

1. Name.....
2. Sex            1. Male            2. Female
3. Date of Birth    Day..... Month.... Year.....
4. Nature of Birth    1. Single    2. Multiple
5. If multiple, is child  
1 First    2 Second    3 Third
6. Birth ( Address ) .....

10. Name.....
11. Is this woman usual member of this Household    1 Yes            2 No
12. Date of birth... Yr..... Mon..... Day.....
13. Age (in completed years).....
14. Age at first marriage (in completed years) .....
15. Duration of first marriage (in completed year) .....

7. Did the birth occur in  
Hospital / Dispensary / Maternity  
Home or Clinic?    1 Yes    2 No
8. Attendant at delivery    1 Doctor  
2 Nurse/ LHV    3 Midwife/trained Dai  
4 Untrained Dai    5 Relative woman  
6 Other
9. Is the child still alive    1 Yes    2 No

If No fill death form ( PDS – 4 )

16. When the first child was born after the  
first marriage (In completed months) .....
17. Age at the time of first birth (In completed  
months).....
18. How many sons and daughter, including  
this child, have ever born to this woman  
Sons.....Daughter.....

OF THESE CHILDREN

- A) How many are the usual member of this  
Household    (If none, write “ 00 “)  
Sons.....Daughter.....
- B) How many are living elsewhere  
(If none, write “ 00 “)  
Sons.....Daughter.....
- C) How many are died (If none, write “ 00 “)  
Sons.....Daughter.....
19. Interval between this and previous live birth  
(in completed years).....
20. Is the preceding child still alive?  
1 Yes    2 No
21. Can you (mother of the child) read and write  
1 Yes    2 No
22. If code “ 1 “ in question – 21, write her  
educational level ( write the relevant code)  
.....

PART – III      PARTICULARS OF FATHER  
-----

23. Name.....
24. Date of Birth      Day.....      Month.....      Year.....
25. Age ( in completed years ).....
26. Age at first marriage ( in completed years ).....
27. Can you ( father of the child ) read and write      1      Yes      2      No
28. If code “ 1 “ in question – 27, write his educational level (write the relevant code).....
